

**Amendments to the Claims:**

*This listing of claims will replace all prior versions, and listings, of claims in the application:*

1. (previously presented) A touch screen control system comprising a touch screen having first and second conductive layers arranged to be brought together by touching of the screen, and a detection system arranged to detect a contact position at which the screen is touched by monitoring electrical signals from at least one of the layers, wherein the system further comprises an antenna, and the detection system includes a proximity sensing signal generator arranged to generate a proximity sensing signal to be transmitted between the antenna and the first layer via a user of the system, and the detection system is further arranged to receive the transmitted proximity sensing signal and determine therefrom a distance between a part of the user and the touch screen, wherein the detection system is arranged to alternate between a touch position sensing mode, in which it is arranged to determine the contact position, and a proximity sensing mode, in which it is arranged to measure said distance between a part of the user and the touch screen.

2. (original) A system according to claim 1, wherein the first layer has two contact elements extending along opposite sides thereof.

3. (original) A system according to claim 2, wherein the detection system is arranged to connect the contact elements to different potentials so that the potential of each of the layers varies with a distance from each of the two contact elements thereby to enable sensing of the contact position.

4. (canceled)

5. (original) A system according to claim 2, wherein the detection system is arranged to receive the proximity sensing signal via at least one of the contact elements.

6. (original) A system according to claim 5, wherein the detection system is arranged to receive the proximity sensing signal via both of the contact elements.

7. (original) A system according to claim 6, wherein the detection system includes a summing device arranged to sum signals from the two contact elements to produce a received proximity sensing signal.

8. (previously presented) A touch screen control system comprising a touch screen having first and second conductive layers arranged to be brought together by touching of the screen, and a detection system arranged to detect a contact position at which the screen is touched by monitoring electrical signals from at least one of the layers, wherein the system further comprises an antenna, and the detection system includes a proximity sensing signal generator arranged to generate a proximity sensing signal to be transmitted between the antenna and the first layer via a user of the system, wherein the detection system is further arranged to receive the transmitted proximity sensing signal and determine therefrom a distance between a part of the user and the touch screen, wherein the detection system is arranged to transmit the proximity sensing signal from the antenna to the first layer, wherein the detection system is arranged to control at least one connection to the second layer such that the second layer acts as a shield for at least part of the time when the proximity sensing signal is being received.

9. (original) A system according to claim 8, wherein the detection system is arranged to determine when the touch screen is being touched, and to control said at least one connection to connect the second layer to at least one fixed potential when the proximity sensing signal is being received and the touch screen is not being touched.

10. (original) A system according to claim 9, wherein said at least one connection comprises two connections arranged to connect the second layer between two different potentials, both when the proximity sensing signal is being received and the touch screen is not being touched, and when the detection system is determining the contact position.

11. (original) A system according to claim 9, wherein the detection system is arranged to electrically isolate the second layer when the proximity sensing signal is being received and the touch screen is being touched.

12. (canceled)

13. (currently amended) A system according to claim 20, ~~A touch screen control system comprising a touch screen having first and second conductive layers arranged to be brought together by touching of the screen, and a detection system arranged to detect a contact position at which the screen is touched by monitoring electrical signals from at least one of the layers, wherein the system further comprises an antenna, and the detection system includes a proximity sensing signal generator arranged to generate a proximity sensing signal to be transmitted between the antenna and the first layer via a user of the system, and the detection system is further arranged to receive the transmitted proximity sensing signal and determine therefrom a distance between a part of the user and the touch screen, wherein the detection system comprises a touch screen controller arranged to detect the contact position, and a proximity sensing system including the proximity sensing signal generator.~~

14. (original) A system according to claim 13, wherein the touch screen controller is arranged to receive said electrical signals, including the proximity sensing signal from the touch screen, and the proximity sensing system is arranged to receive the proximity sensing signal from the touch screen controller.

15. (original) A system according to claim 14, wherein the touch screen controller is arranged to send a synchronisation signal to the proximity sensing system to enable the proximity sensing system to determine when it is receiving the proximity sensing signal from the touch screen controller.

16. (original) A system according to claim 15, wherein the touch screen controller is arranged to transmit the synchronisation signal to the proximity sensing system on the same connection as the proximity sensing signal.

17. (previously presented) A touch screen control system comprising a touch screen having first and second conductive layers arranged to be brought together by touching of the screen, and a detection system arranged to detect a contact position at which the screen is touched by monitoring electrical signals from at least one of the layers, wherein the system further comprises an antenna, and the detection system includes a proximity sensing signal generator arranged to generate a proximity sensing signal to be transmitted between the antenna and the first layer via a user of the system, and the detection system is further arranged to receive the transmitted proximity sensing signal and determine therefrom a distance between a part of the user and the touch screen further comprising a filtering capacitor arranged to be connected between one of the layers and ground during determination of the contact position, but disconnected during measurement of said distance between a part of the user and the touch screen.

18. (canceled)

19. (canceled)

20. (new) A touch screen control system comprising a touch screen having first and second conductive layers arranged to be brought together by touching of the screen, and a detection system arranged to detect a contact position at which the screen is touched by monitoring electrical signals from at least one of the layers, wherein the system further comprises an antenna, and the detection system includes a proximity sensing signal generator arranged to generate a proximity sensing signal to be transmitted between the antenna and the first layer via a user of the system, and the detection system is further arranged to receive the transmitted proximity sensing signal and determine therefrom a distance between a part of the user and the touch screen.

21. (new) A system according to claim 20, wherein the antenna is within a seat of a vehicle having the touch screen control system, the proximity sensing signal passing from the antenna and through a body of the user prior to receipt by the first layer.

22. (new) A system according to claim 20, wherein the electrical signals from the at least one of the layers reflect an electrical potential resulting from the first and second conductive layers being brought together.

23. (new) A system of according to claim 22, wherein the electrical potential varies depending on the contact point at which the first and second layers are brought together such that no contact point is at the same electrical potential as another contact point.
